Venue: Drama Hall

No. of Students Participated:55

- To save the water that falls down on earth in the form of rain.
- To eradicate "water shortage" during the summer season.
- If houses are constructed along with rainwater harvesting plan, it will avoid the huge loss caused due to erosion which is caused by runoffs.
- With the system of rainwater harvesting scheme, the adverse effect caused by the flood can be reduced because improper storage of rainwater is the first and foremost cause of flood during the "rainy season".
- It reduces the draining of available groundwater and increases the level of groundwater."

With the above objectives and as Anantapur is the 2nd lowest rainfall receiving place in the Country, it is very important to catch the rain water and conserve. As a part of it, eco club members digged 8 Percolation pits in the campus.
